Conference	Report.	AS-3.	2/4//2/	- ~ - ~ - ~ - ~ - ~ - ~ - ~ - ~ - ~ - ~

- C. The receiver choice is expected in July.
 4. The impedances to be expected of the various antennas were specified as 50 to 1200Ω, ± 45° per the equipment spec. Both gave the opinion that low impedances were most probable, in the 50Ω region.
 A. A study under another contract is now in process to determine what these impedances are.
- 5. Tolerance on the 150 cps multivibrator frequency is \(\frac{1}{2}\)5% by present design limits. These will be retained unless the customer advises negatively.
- 6. Power measurement techniques were gone into.

 said ladder-type resistive loads made up of carbon resistors, and a series RF ammeter, were his usual loads.

 Correlation between his organization and is to be continued on this matter.
- 7. The specification was based on a band-switched transmitter, so far as test frequencies are concerned. It was recommended that octave frequencies be used to test instead, namely 3, 6, 12, 18, 24, and 30 mc.
- 8. The currently used method of saturation coding of magnetic tape to eliminate random noise triggering was explained.
- 9. The Amphenol checkerboard connector as used on the AN/TRC-6 was discussed as a possible desirable connector for the AS-3 System. was to investigate this connector.
